

Command EDIT EXTENDED for HMG library.

(c) Cristóbal Mollá [cemese@terra.es]

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

Description

EDIT EXTENDED, is a command to manage a database.

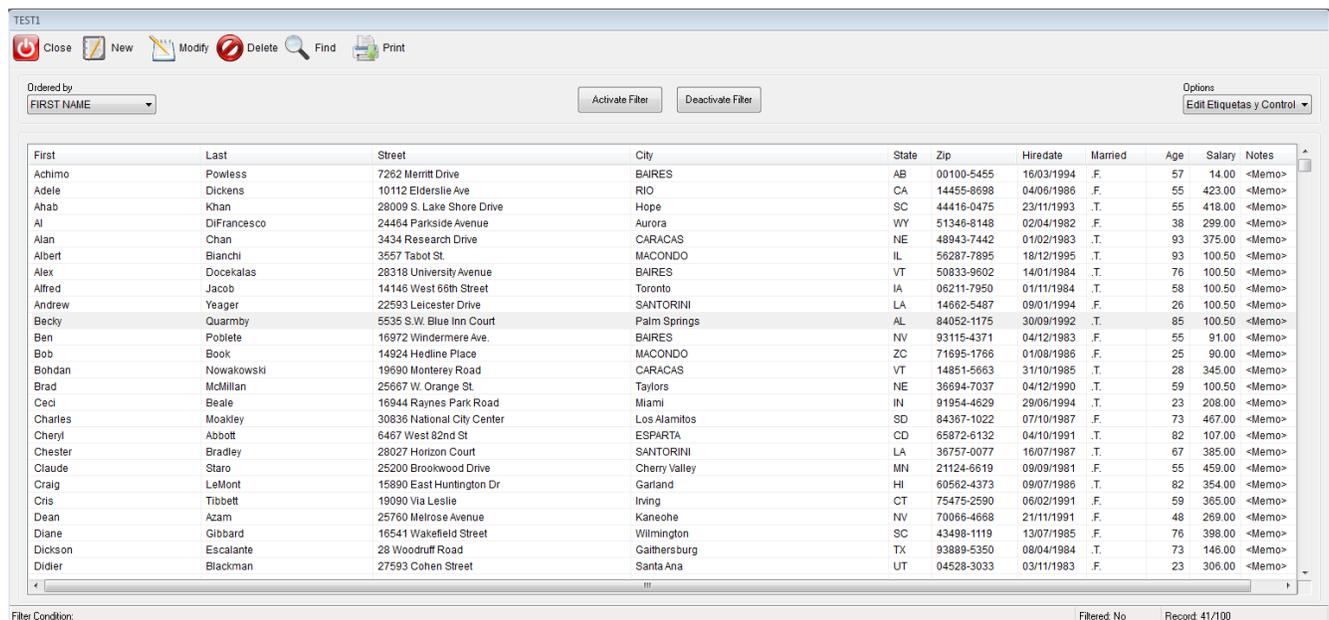

Initially it is made to manage databases using DBFNTX y DBFCDX drivers.

Others databases drivers will render unexpected results.

Limitations

- Does not implement ListBox or ComboBox
- You can not search by memo neither by logical fields.
- You can not search on compound indexes.
- If you do, the search will use just the first field on the compound index.

Filter Condition: Filtered: No Record 41/100

Syntax

All the parameters are optional.

```
EDIT EXTENDED ;
[ WORKAREA cWorkArea ] ;
[ TITLE cTitle ] ;
[ FIELDNAMES acFieldNames ] ;
[ FIELDMESSAGES acFieldMessages ] ;
[ FIELDENABLED alFieldEnabled ] ;
[ TABLEVIEW alTableView ] ;
[ OPTIONS aOptions ] ;
[ ON SAVE bSave ] ;
[ ON FIND bFind ] ;
[ ON PRINT bPrint ]
```

Basic use

EDIT EXTENDED WORKAREA cWorkArea

Edit Window

The image shows a 'Modify record' dialog box with a title bar containing 'Cancel', 'Ok', and 'Copy' buttons. The form contains the following fields:

- First: Andrew
- Last: Yeager
- Street: 22593 Leicester Drive
- City: Kempton Park
- State: LA
- Zip: 14662-5487
- Hiredate: 09/01/1994
- Married:
- Age: 26
- Salary: 100.50
- Notes: This is a test for record 52

Two red arrows point to the 'State' field and the text 'No ListBox'.

If no parameter is passed, EDIT command will use the open database in the actual area.

- [cWorkArea] Text string with the alias name of the database to work on.
By default, it will be the active one.
- [cTitle] Text string with the title of the main browse window.
By default, it will be the alias of the active db.
- [acFieldNames] Text array with the descriptive name of the fields in the database
Should agree with database fields number.
Should agree with database fields number the field names. ???
- [acFieldMessages] Text array to be used on the status bar when adding or editing a record
Should agree with database fields number.
If it is empty, will be filled with system default values.
- [alFieldEnabled] Logic array showing if the corresponding field is enabled at editing time.
Should agree with database fields number.
By default, all fields will be enabled (.t.).
- [aTableView] Logic array showing if the corresponding field is visible on the main browser table.
Should agree with database fields number.
By default, all fields will be visible (.t.).
- [aOptions] 2 level array. First one is a text array, while the second contains code blocks
First subarray contains the option descriptions.
Second one contains the code blocks to be executed when selected.
If none is passed, the choose option list will be disabled.
- [bSave] Code block like { |aValues, lNew| Action }
which will be used when save button is clicked.
- aValues will contain the fields to save.
- lNew shows if you are adding new (.t.) or editing (.f.) record
Should return .t. to exit the edit mode.
If empty, the fields will be saved by internal routine.
- [bFind] Code block to be used when SEARCH button is clicked.
If empty, internal routine will be used.
- [bPrint] Code block to be used when LIST button is clicked.
If empty, internal routine will be used.

Función ABM3() <Editexplus> para la librería HMG.

It is a modification to the ABM2() function (EDIT EXTENDED command)

The parameters are the same as the EDIT EXTENDED command plus an additional one (the 11th) which is the name of a file with the description of the form. (xxxxx.arr)

This file is generated automatically (as explained below).

See DEMO.PRG to see example on calling EDIT EXTEND command

Example with 2 horizontally distributed columns

The screenshot shows a 'Modify record' dialog box with a light blue header bar containing 'Cancel', 'Ok', and 'Copy' buttons. The main area is divided into two columns. The left column contains: 'First' (Andrew), 'Street' (22593 Leicester Drive), 'State' (LA), 'Hiredate' (09/01/199), 'Age' (26), and 'Notes' (This is a test for record 52). The right column contains: 'Last' (Yeager), 'City' (SANTORINI), 'Zip' (14662-5487), 'Married' (checkbox), and 'Salary' (100.50). Red arrows point to the 'State' and 'City' dropdown menus, both labeled 'ListBox'. A red arrow points to the 'Notes' text area, labeled 'Size changed'.

Example with 3 vertically distributed columns

The screenshot shows a 'Modify record' dialog box with a light blue header bar containing 'Cancel', 'Ok', and 'Copy' buttons. The main area is divided into three columns. The first column contains: 'First' (Alan), 'Last' (Chan), 'Street' (3434 Research Drive), and 'City' (CARACAS). The second column contains: 'State' (NE), 'Zip' (48943-7442), 'Hiredate' (01/02/198), and 'Married' (checkbox). The third column contains: 'Age' (93), 'Salary' (375.00), and 'Notes' (This is a test for record 35).

Compatibility Mode:

Without including file "dBaseName.arr" (The 11th parameter) it goes in compatibility mode.

ListBoxes are implemented independently of parameter 11, but they can work in conjunction with him. (or without him)

This form was traditionally generated but includes ListBox.

The ListBox appears only if it is included the corresponding function, as explained below.

By not including the additional parameter, the traditional arrangement is used but the functions that determine the use of the ListBox are recognized.

If you want full compatibility please do not include those functions.

The screenshot shows a 'Modify record' dialog box with the following fields and values:

- First: Cheryl
- Last: Abbott
- Street: 6467 West 82nd St
- City: ESPARTA
- State: CD
- Zip: 65872-6132
- Hiredate: 04/10/199
- Married:
- Age: 82
- Salary: 107.00
- Notes: This is a test for record 77

Red arrows point to the 'City' and 'State' dropdown menus, with the label 'ListBox' in red text between them.

Creation of array definition files

Simply running 'ABM3generar()' in "h_edit_makeArray.prg"
(This function should not be available in the final project)

In the DEMO in the menu / Make arrays / make all 4 arrays.

4 files are created so that you choose the one that best suits your need.

You can choose any and take it where it will be used. You can change the name if you wish.

'ABM3generar()' called without parameters uses the active database.

If the table is indicated, it will generate the definition files for that table.

In the final project should be "h_edit_exPlus.prg" where is the ABM3() function along with the newly created .arr file.

How to make the ListBox

For this, a simple function must be created for each text control.
The name of this function must have the form 'LB_dbName_FieldName' and must return an array of text with the list of options.

Example in 'demo.prg'

```
FUNCTION LB_Test2_STATE()
RETURN {"AB","CD","AR","CA","AO","ZC","SC","WY","NE","IL","VT","IA","LA"}
```

In this other example, in the field 'nomina' of the 'personal' table, data is entered from the 'NomDefi' table (field 'personal')

```
FUNCTION LB_personal_NOMINA()
  local nRegistro := 0
  local aOpciones := {}
  nRegistro := NomDefi->( RecNo() )
  NomDefi->( dbGoTop() )
  Do While NomDefi->( !Eof() )
    Aadd (aOpciones,NomDefi->nomina)
    NomDefi->( DbSkip() )
  End
  NomDefi->( dbGoTo( nRegistro ) )
RETURN aOpciones
```

This functions must be visible when calling ABM3 ()

How to make the ComboBox

I introduced a new parameter (the 12th) to have Combobox's.
It must be an array that contains one element for each control (field)
Only those that match a text field matter, the others will be ignored.
This should contain the reference to the Combobox table and source field.
As follows: **"Table->Field"**

```
aCombo := {,,,"Ciudades->City",,,,,,}
ABM3 (,,,,,aOptions,,, "TEST1.3h.arr",aCombo)
```

See demo.prg

*The next step could be to pass an array with the list of options and thus eliminate the inclusion of functions.
I would like to have opinions on which of the methods seems more appropriate, to avoid overloading the tool. (I mean, which one should I remove)*

How to make small modifications

A relatively simple function is provided for this purpose.

It reads the array "xxxx.arr" with the definition of the controls and labels and allows you to modify their relative positions and their size, as well as the text of the messages.

Attention: Use it very carefully.

It is a very elementary function. It does not perform any checks. It has no undo.

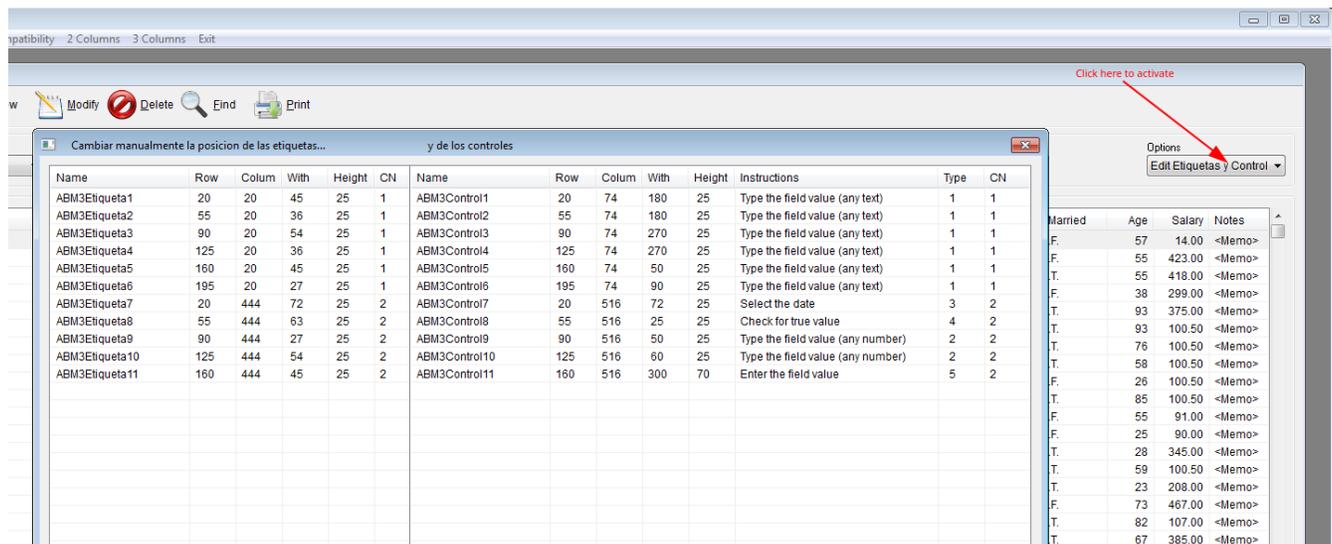

If everything breaks down the only solution is to recreate the file.

It does not recalculate the size of the window so a control may end up outside the visible space.

It is recommended only for small adjustments although in practice it is very powerful.

Radical changes in position could be made, including adding new text labels.

Its use is at the discretion (and risk) of the designer. It is provided only as an option.

The file "h_edit_ModifArray.prg" contains the function "ModificarArray()"

The 'user option' available in Edit Extended is used in the DEMO (see demo.prg)

This is available in the List window at the top right.

A box opens with the position of the defined labels and controls.

It works on the definition file (xxxx.arr) that is currently in use.

With Click or Enter you can modify the value of any box. As mentioned it does not do any control.

The array is saved when closing this window (it doesn't matter if something was changed or not)

To make the changes effective, you must close the list window and open it again to read the recently modified file.

Summarizing

- The file 'h_edit_exPlus.prg' is the only one that should be included in the final project.
-
- The file 'h_edit_makeArray.prg' should only be where the controls are defined.
-
- A separate executable can be generated for that effect. - (todo)
-
- If 'h_edit_ModifArray.prg' is used, it should only be where the controls are defined.
- It should never be available to the user because it will destroy the definition file (xxxx.arr)
-
- The generated 'xxxx.arr' files must be copied to the final project, next to the tables.
-
- The functions 'LB_dbName_FieldName' must exist (be visible) only in the final project.

Technical Considerations

.....to be done.....
